FIXED INCOME OUTLOOK 2022

JIM CIELINSKI

Global Head of Fixed Income

FIXED INCOME: THE LAST HURRAH

Jim Cielinski
Global Head of Fixed Income

The lagged impact of policy stimulus should drive elevated earnings and inflation, but as 2022 progresses a more familiar picture will likely emerge. Jim Cielinski, Global Head of Fixed Income, believes it may be too soon to discard what has gone before.

Key takeaways

- » The debate surrounding the direction of inflation is likely to dominate markets in early 2022, stoking fears of an overheating economy.
- » Yet there are plenty of factors to suggest central banks are correct to take a gradual approach to removing monetary policy accommodation.
- » Ultimately, we see a manageable rise in bond yields, with some of the disinflationary forces beginning to reassert themselves as distortions in the global economy start to ease.

"Things will probably get worse before they get better." Such is the common refrain of parents to worried children or doctors to concerned patients. It is also the likely near-term prognosis for inflation.

Dealing with COVID-19 created acceptably higher norms for monetary and fiscal policy accommodation and the past stimulative action is still filtering through the economy, buoying corporate earnings and asset prices. The US Federal Reserve (Fed) announced in November it will taper (reduce) its asset purchases. Yet, tapering is not tightening. It is just being less accommodative. This might sound like semantics, but it is important because it implies that the Fed still believes support is needed for the economy to reach both its average inflation and full employment goals. Should we worry that the Fed may be making a policy mistake and its view that higher inflation is transitory (central bank jargon for temporary) is wrong?

Inflation: the power of three

For inflation to be more permanent requires three key factors. First, closing the output gap. This is the difference between what the economy is currently producing and what it has the long-term potential to produce efficiently. A negative output gap indicates spare capacity (slack) in the economy. A positive output gap occurs when the economy is growing above trend and demand is very high, contributing to inflation. On this score, we do appear to be entering an inflationary period (Figure 1). The caveat is that output gaps are difficult to predict accurately.

Service sector inflation tends to be stickier than goods inflation. When was the last time your hairdresser offered you a price cut?

Second, we need to see higher wages. Wage pressures are evident although it is proving hard to disentangle COVID distortions from longer-term trends. Participation rates (workers willing to work as a percentage of the workforce) seem to have fallen as some older workers have opted to retire early (partly aided by buoyant asset markets on pension pots) or health concerns are discouraging them from working. Wages for lower paid workers and minimum wages have increased, and this could encourage workers in higher salary tiers to demand higher wages to maintain pay differentials. If, as we suspect, commodity prices subside, this should help to lower inflation rates next year and potentially dampen wage bargaining rounds. Where we have some concerns is the cost of housing. Tenants' and owners' equivalent rents constitute around 40% of US Core CPI¹ and we expect inflation here to remain elevated into 2022. The composition of growth and inflation will also be an interesting dynamic in 2022 as spending is expected to move towards services and away from goods.

Figure 1: US economic growth looks set to exceed its potential

US real output gap as a % of GDP

Source: Bloomberg, Congressional Budget Office, 31 December 1971 to 31 December 2031, as of 5 November 2021. Figures beyond 2020 are estimates and are not guaranteed.

Third, private sector credit creation needs to pick up. By this, we mean more ebullient consumers need to increase borrowing. With more money sloshing around the economy, this can lift prices through the money multiplier effect as banks re-lend deposited money. On this score, private sector credit demand does not seem elevated. In the US, consumer credit grew at an annual rate of 5.6% in the third quarter of 2021; this compares with annual growth of 4.6% in 2019, so hardly a blistering uptick.² In China, credit growth is weak as authorities crack down on debt growth, while in Europe, credit growth is consistent with recent years (Figure 2).

Taken together, we think inflation will subside later in 2022, not least because inflation can sow the seeds of its own demise if it acts as a tax on consumers, curtailing demand. It also hurts less wealthy households (who have a higher marginal propensity to consume) more than the (asset) rich. Moreover, there exist some oddities of the last 18 months, which, as they wash through the system, we believe should bring inflation back down.

Imaginary numbers and tapering expectations

Set the bar low and it is easy to beat it. There was a huge rebound in corporate earnings in 2021 as vaccine rollouts galvanised the economic recovery but earnings and economic growth are both set to slow in 2022, if only from harder year-on-year comparisons. Lockdown-induced supply chain imbalances (eg, container ships in the wrong ports, lack of microchips, short-staffed logistics and hospitality businesses) are still present but over 2022 we expect the pieces of the jigsaw to slowly reassemble. For now, the inflation risks look tilted to the upside, but should the inventory building by companies not reach customers swiftly enough, it may lead to product overhangs.

Consumers were also boosted by the temporary wealth increase from pandemic-related forced savings and government special payments, but wealth increases are typically less effective than increases in income at altering long-term spending patterns. If so, buoyant retail

Figure 2: Eurozone credit creation is far from excessive

Eurozone bank loans to private sector (6m % change) and ECB Credit demand indicator

sales could start to come under pressure as personal income levels revert to trend (Figure 3). Personal savings levels are also moving back to trend levels. A key test for corporate credits in 2022 will be identifying those cash flows that were temporarily buoyed by these effects.

Another important aspect is China. Chinese authorities are dedicated to reshaping the economy by taming debt levels (deleveraging), increasing competition and smoothing wealth imbalances. The corollary is that economic growth in China may slow. Gross domestic product (GDP) growth in China of 4.9% (year-on-year) in the third quarter of 2021

is consistent with the same rate a year earlier. For a world that has been used to China growing at an average 8.4% annualised in the years 2010-14 and 6.6% annualised in the years 2015-19, this marks a significant slowdown, with wider implications for global growth.³

So, the market may be exaggerating tightening fears. Remember the last time the US Fed tapered, it concluded in October 2014, but the first interest rate hike did not occur until December 2015 and rates then stayed on hold for a year (Figure 4). If inflation shows signs of subsiding by summer, we could be in for a similarly moderate

Figure 4: Tapering need not mean imminent rate hikes

US monetary policy history (2010 to 2021)

tightening episode – for 2022 at least. Beyond the US, the European Central Bank's President Christine Lagarde has already pushed back against the prospect of raising its policy interest rate in 2022. Memories of the premature hikes of 2011 enacted by then-ECB President Jean-Claude Trichet, which contributed to a stalling of recovery in Europe, may still linger.

Tug of war: demand for income meets policy inflection

To disagree with the Fed and ECB's relatively sanguine view on inflation would mean believing we are on a completely different path to that which preceded COVID. Markets have been notorious for overestimating hike paths over the last couple of decades, although we think the Fed and the ECB have become better recently at communicating the likely policy path.

We believe the disinflationary and deflationary forces of technology and digitalisation remain intact while repaired trade links will reignite global competition and efficiencies. If anything, COVID disruption may have helped elongate the mid-cycle phase of the economic and credit cycles.

For credit investors, this mid-cycle environment is likely to extend some of the characteristics of 2021 into 2022. We expect companies to continue to repair balance sheets and for the high yield default rate (the proportion of companies failing to meet repayments to bondholders) to remain subdued. Exceptions may lie in China where stresses in property could be ongoing as the sector adjusts to more prescriptive debt permissions.

Given we are not anticipating a big adjustment higher in bond yields, investors will continue to seek out yield. This should be supportive of high yield, which is also helped by its greater sensitivity to corporate conditions. We expect improving corporate fundamentals to see more high yield issuers transition to investment grade, although 2022 is also likely to see greater performance dispersion as the inflection in policy leads investors to pay greater attention to debt levels. Relatively low spreads mean investment grade bonds are likely to find their performance dictated more by moves in interest rate markets.

The tightening in spreads has been ubiquitous. Mortgage- and asset-backed securities have witnessed similar fundamental improvement, offering a blend of income in conjunction with lower leverage. Many sectors of the mortgage market, having been the source of the Global Financial Crisis in 2008, have been in repair mode for more than a decade.

The relatively high headline inflation figures anticipated in early 2022 means we are likely to hold onto the rise in bond yields seen in the late half of 2021. Somewhat higher bond yields may be no bad thing. A gentle creep higher is manageable, offering opportunities for reinvestment at higher yields. Insurers, banks and pension funds would likely benefit.

In fact, the recent uptick in bond yields, together with higher equity prices, might lead to higher demand for bonds from pension funds in 2022. This is because as the funding gap between the assets of a pension fund and its liabilities (amount needed to pay out expected

Figure 5: Credit spreads are close to their historical tights

Spread minimum and maximum over last 20 years

Minimum, average and maximum spread, plus current spread (9 November 2021) over 20 years to 9 November 2021. EM = emerging markets, HY = high yield, IG = investment grade. Basis point (bp) equals 1/100 of a percentage point. 1 bp = 0.01%, 100 bps = 1%.

lifetime payments to retirees) shrinks, there is a growing incentive for pension funds to lock in the matched liabilities. Typically, this involves buying more bonds, given that they have less capital volatility.

This comes at a time when the supply of bonds in some areas may diminish. Economic recovery means government revenues should remain on an improving path. As such, we expect most governments (absent another shock) to borrow less in 2022. The International Monetary Fund projects net government borrowing to fall from 10% of GDP of developed economies in 2021 to 5.4% in 2022.⁴ Those who are cynical about the true extent of central bank independence might note how less net government bond issuance coincides with the reduction in central bank asset purchase programmes. Regardless, less supply could stymie upward pressure on government bond yields from the absence or reduced presence of central bank net purchases.

Where we do see supply rising in 2022 is among labelled bonds. By this we mean bonds linked to environmental, social and governance (ESG) factors. This is an area with momentum as consumers, clients and governments demand action to improve the environment, tackle inequalities and promote good corporate governance. ESG commitments will require a lot of financing, and fixed income has a role to play in meeting the gap.

Where inflation levels out at is important as it can impact the desire to hold bonds not just at a return level but at a diversification level. Figure 6 demonstrates that when inflation is lower (below 3%) there is typically a positive correlation between US government bond yields and US

Bonds bring forward expenditure by providing immediate financing that is paid back over time, making them a useful capital-funding vehicle for transformative long-term projects.

equities. As bond prices typically move in the opposite direction to bond yields, diversification benefits are more prevalent in a low inflation environment where bond yields fall and prices rise at the same time that equities fall.

There is therefore more than just the credibility of the Fed at stake if inflation proves not to be transitory. Higher borrowing costs and weaker diversification are just two of the unwelcome outcomes if inflation becomes unanchored. Yet it is hard to see short-term supply problems overpowering long-term structural trends. 2022 will start out looking inflationary but we anticipate the more familiar disinflationary world to reassert itself as the year draws to a close.

What is certain is the appetite for greater yield and income is insatiable. Inflation is the risk that can upend the positive backdrop, primarily because it is the factor with the power to frighten both markets and policy makers. If central bankers can avoid panic and ride out impending price pressures, markets should exhibit higher volatility but emerge relatively unscathed, supported by the recovery in cash flow and earnings.

Glossary

Asset-backed securities (ABS): A financial security which is 'backed' with assets such as loans, credit card debts or leases. They give investors the opportunity to invest in a wide variety of income-generating assets.

Corporate fundamentals: Attributes of a company that contribute to the valuation of its securities, such as a company's earnings or the evaluation of its management team, as well as wider economic factors.

Correlation: How far the price movements of two variables match each other in their direction. If variables have a correlation of +1, then they move in the same direction. If they have a correlation of -1, they move in opposite directions. A figure near zero suggests a weak or non-existent relationship between the two variables.

Deflationary: Contributing to a decrease in the price of goods and services across the economy, usually indicating that the economy is weakening.

Disinflationary: Contributing to a decrease in the rate of inflation.

Dispersion: a statistical term that describes the size of the distribution of values expected for a particular variable

ESG: Environmental, social and governance (ESG) are three key criteria used to evaluate a company's ethical impact and sustainable practices.

Fiscal policy/fiscal stimulus: Government policy relating to setting tax rates and spending levels. It is separate from monetary policy, which is typically set by a central bank. Fiscal austerity refers to raising taxes and/or cutting spending in an attempt to reduce government debt. Fiscal expansion (or 'stimulus') refers to an increase in government spending and/or a reduction in taxes.

Gross domestic product: The value of all finished goods and services produced by a country, within a specific time period (usually quarterly or annually). It is usually expressed as a percentage comparison to a previous time period, and is a broad measure of a country's overall economic activity.

High yield bond: A bond that has a lower credit rating than an investment grade bond. Sometimes known as a sub-investment grade bond. These bonds carry a higher risk of the issuer defaulting on their payments, so they are typically issued with a higher coupon to compensate for the additional risk.

Inflation: The rate at which the prices of goods and services are rising in an economy. The CPI and RPI are two common measures. The opposite of deflation.

Investment-grade bond: A bond typically issued by governments or companies perceived to have a relatively low risk of defaulting on their payments. The higher quality of these bonds is reflected in their higher credit ratings when compared with bonds thought to have a higher risk of default, such as high-yield bonds.

Monetary policy/monetary stimulus/monetary tightening: The policies of a central bank, aimed at influencing the level of inflation and growth in an economy. It includes controlling interest rates and the supply of money. Monetary stimulus refers to a central bank increasing the supply of money and lowering borrowing costs. Monetary tightening refers to central bank activity aimed at curbing inflation and slowing down growth in the economy by raising interest rates and reducing the supply of money.

Mortgage-backed security (MBS): A security which is secured (or 'backed') by a collection of mortgages. Investors receive periodic payments derived from the underlying mortgages, similar to coupons.

Spread/credit spread: The difference in the yield of a corporate bond over that of an equivalent government bond.

Taper: A central bank's slowing down of the rate of its bond buying programme (quantitative easing).

Volatility: The rate and extent at which security prices move up and down. Large movements indicate high volatility.

Investing involves risk, including the possible loss of principal and fluctuation of value.

Fixed income securities are subject to interest rate, inflation, credit and default risk. The bond market is volatile. As interest rates rise, bond prices usually fall, and vice versa. The return of principal is not guaranteed, and prices may decline if an issuer fails to make timely payments or its credit strength weakens.

Mortgage-backed securities (MBS) may be more sensitive to interest rate changes. They are subject to extension risk, where borrowers extend the duration of their mortgages as interest rates rise, and prepayment risk, where borrowers pay off their mortgages earlier as interest rates fall. These risks may reduce returns.

Securitized products, such as mortgage- and asset-backed securities, are more sensitive to interest rate changes, have extension and prepayment risk, and are subject to more credit, valuation and liquidity risk than other fixed-income securities.

High-yield or "junk" bonds involve a greater risk of default and price volatility and can experience sudden and sharp price swings.

Equity securities are subject to risks including market risk. Returns will fluctuate in response to issuer, political and economic developments.

Environmental, Social and Governance (ESG) or sustainable investing considers factors beyond traditional financial analysis. This may limit available investments and cause performance and exposures to differ from, and potentially be more concentrated in certain areas than, the broader market.

Diversification neither assures a profit nor eliminates the risk of experiencing investment losses.

S&P 500® Index reflects U.S. large-cap equity performance and represents broad U.S. equity market performance.
